

"I just can't figure it out. There are stars out there, and they just don't fit the theory."

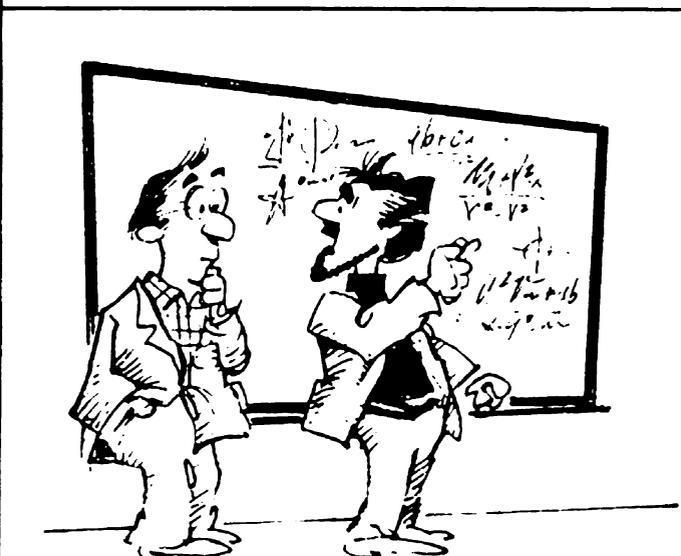

"We're trying to get gas to start spinning by itself. It's just a matter of waiting long enough."

"The background radiation is still flowing from all directions. How many Big Bangs were there?"

"We decided to prove that matter shooting toward a single point would stop and stick together."

"I'm trying to figure where the law of gravity came from. None of the Big Bang calculations can explain it."

"Yes, I know we've already spent \$50 million trying to find lumps in the radiation, but I think with another government grant for \$80 million, and flying time on the shuttle, we'll succeed. We might be able to bring some of the lumpy radiation back to earth."
